

Really only 1 function is needed to draw all the tallies. Have the 1 function take in the number that becomes the number of tallies it's supposed to draw. Mod that number by 25, and also floor divide it by 25. The former gets us the amount to be drawn individually and the latter gets us how many rows of 25 tallies we draw. This allows me to separate the tallies into rows. Then I use turtle to draw out those tallies for each part. All the function needs as input is a single number.
